Jira Project "Pickaboo.com"

To start the project we need to create a project named as the project name in the project management tool Jira.

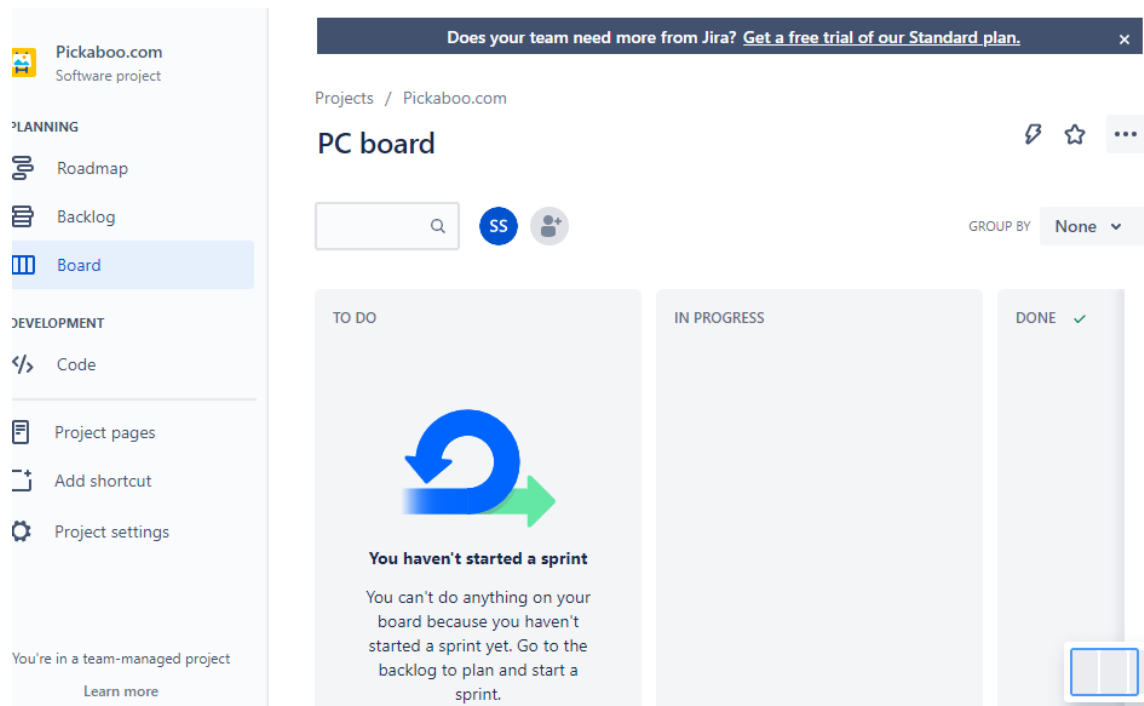

Figure: 01

Here in Figure: 01, the project "Pickaboo.com" has been created. As we are going to work on the "Pickaboo.com" web application.
After creating the project we need to create an issue under this project. Where we will describe the issue, issue type, reporter and assign the developer who will be responsible to fix the bug/problem.
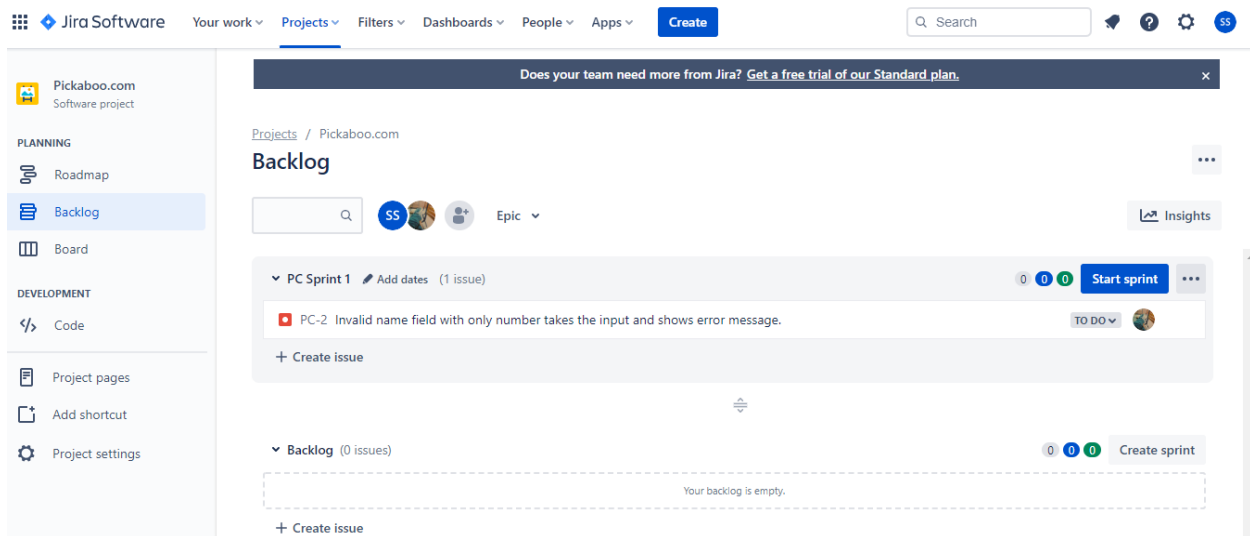

Figure: 02

Here in Figure: 02, the issue is, that when a user creates an account in "Pickaboo.com" he/she can enter an invalid name with only a number and the system takes the input as invalid data. All the descriptions and steps have been written by the time of creating the issue along with a valid attachment.

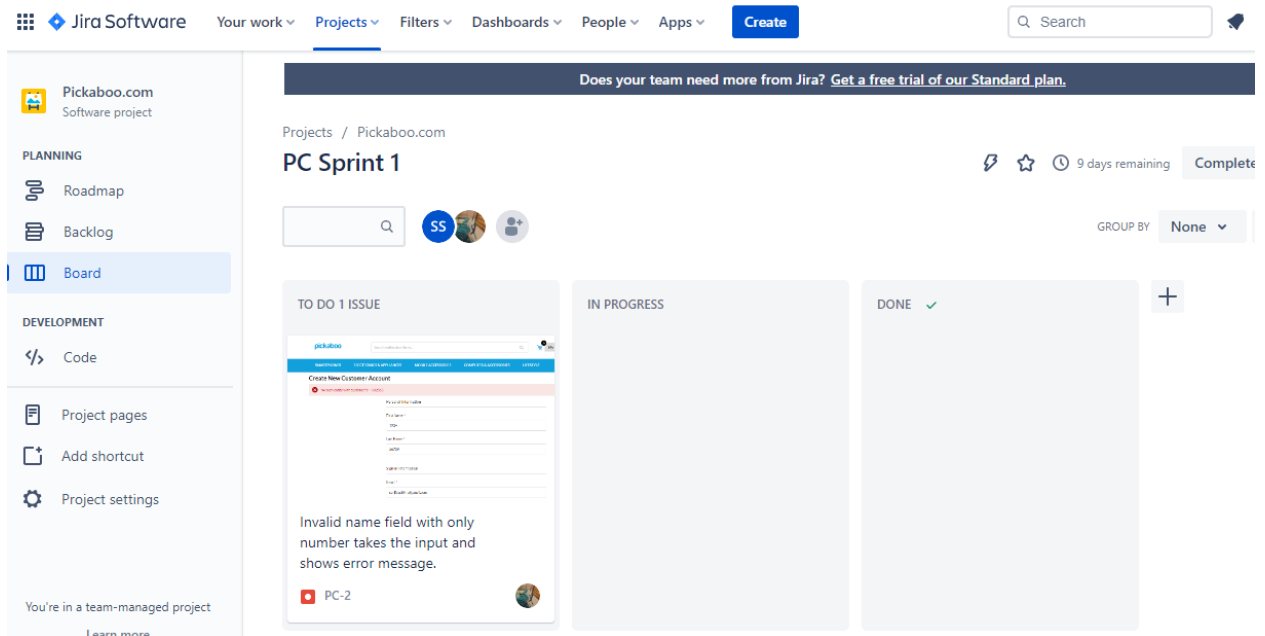

Figure: 03

After creating the issue we will start the sprint by clicking the "Start sprint" button. Here in Figure: 03, the PC Sprint 1 has been started, the issue is in the "TO DO" stage. This means the assignee has not started the work yet.

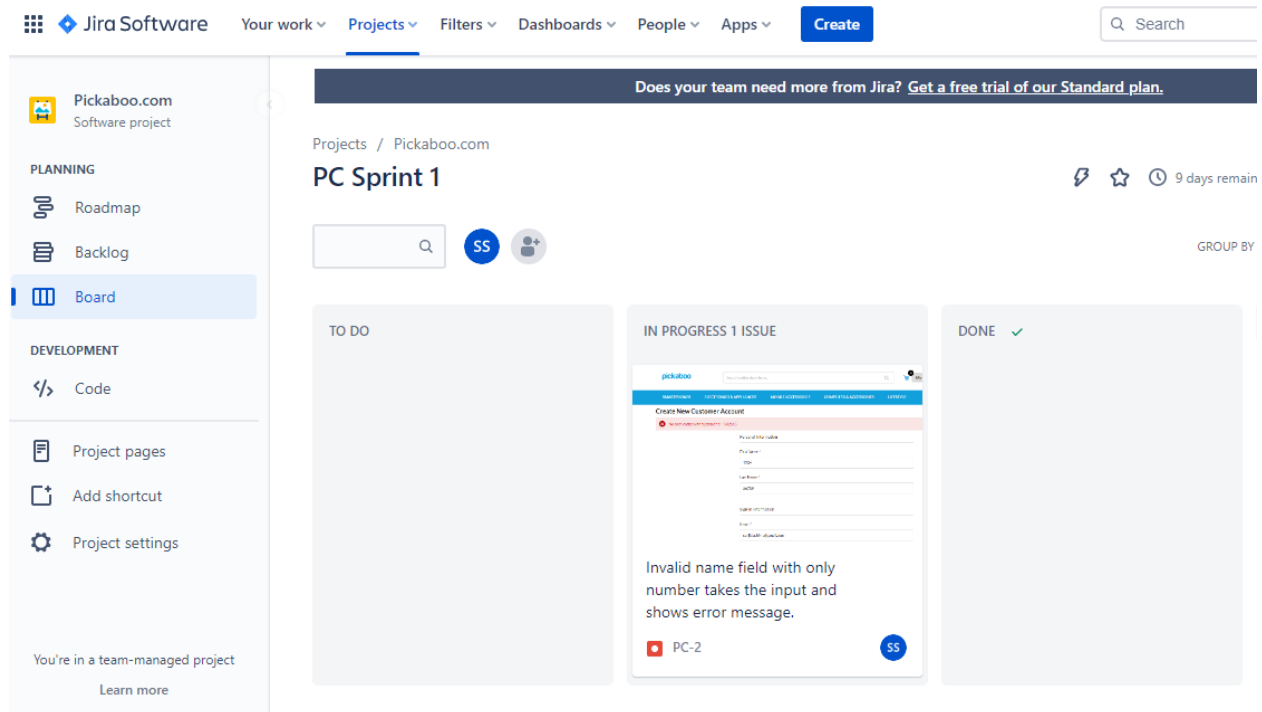

Figure: 04

Here in Figure: 04, the issue is in "IN PROGRESS " stage, which means the assignee is working on it.

Figure: 05

Here in Figure: 05, the issue is in the "DONE" stage, which means the developer or assignee has fixed the bug/issue and has been updated in the system.
